```

```
New nucleic acid molecule for diagnosing, preventing or treating diseases such as proliferative (e.g. cancer), inflammatory, immune, metabolic, genetic, bacterial and viral diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to an isolated nucleic acid molecule encoding a polypeptide which is believed to be cytostatic, antiinflammatory, immunosuppressive, antibacterial and virucidal. The composition and methods are useful for diagnosing, preventing and treating diseases such as proliferative (e.g. cancer), inflammatory, immune, metabolic, genetic, bacterial and viral diseases. The present sequence represents a human secreted protein. The present sequence is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     immune, metabolic, genetic, bacterial and viral diseases. The present sequence represents a human secreted protein. The present sequence is available on WIPOWEB and is not in the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Williams LT, Chu K, Lee E, Hestir K, Beaurang PA, Behrens D

The present invention relates to an isolated nucleic acid molecule encoding a polypeptide which is believed to be cytostatic, antiinflammatory, immunosuppressive, antibacterial and virucidal. The composition and methods are useful for diagnosing, preventing and treating diseases such as proliferative (e.g. cancer), inflammatory, immune, metabolic, genetic, bacterial and viral diseases. The present sequence represents a human secreted protein. The present sequence is available on WIPOWEB and is not in the specification.
                                                                                                                                                                                                                                                                         New nucleic acid molecule for diagnosing, preventing or treating dise such as proliferative (e.g. cancer), inflammatory, immune, metabolic, genetic, bacterial and viral diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; full length cDNA; cDNA synthesis; oligo-capping.

                                                                                                                                                                                                                                                                                                                                 RESULT 6
 ద
                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                             clones. 830 cDNA molecules encoding a human protein have been isolated and nucleotide sequences of 5'- and 3'-ends of the cDNA molecules have been determined. Primers for synthesising the full length cDNA molecules have been determined. Primers for synthesising the full length cDNA molecules have length clones were obtained by construction of full length enriched cDNA. The full length clones were synthesised by the oligo-capping method. The primers enable the production of the full length cDNA easily without any special methods. The present sequence is a polypeptide encoded by a full length not form part of the invention. Note: The sequence data for this patent did format directly from EPO
                                                                                                                                              830 Primers useful for synthesizing full length cDNA clones and their use in genetic manipulation.
                                                                            Isogai T, Hayashi K, Ishii S, Kawai Y;

This invention relates to a novel primers useful for synthesising full length cDNA molecules that encode human proteins. Specifically, it refers to secretory or membrane proteins that are potential therapeutic agents/ target molecules in the field of medicine, and in particular genes encoding proteins that are associated with signal transduction, glycoproteins and transcription. The present invention describes a method for efficiently cloning a full length human cDNA from both the 5' and 3' ends using the oligo-capping method. This polypeptide sequence is a full length human protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Cytostatic, Antiinflammatory; Immunosuppressive; Antibacterial; Virucide; cancer; inflammatory; immune; human secreted protein.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New nucleic acid molecule for diagnosing, preventing or treating diseases such as proliferative (e.g. cancer), inflammatory, immune, metabolic, genetic, bacterial and viral diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to an isolated nucleic acid molecule encoding a polypeptide which is believed to be cytostatic, antiinflammatory, immunosuppressive, antibacterial and virucidal. The composition and methods are useful for diagnosing, preventing and rereating diseases such as proliferative (e.g. cancer), inflammatory, immune, metabolic, genetic, bacterial and viral diseases. The present sequence represents a human secreted protein. The present sequence is available on WIPOWEB and is not in the specification.

polymucleotides encoding them. The sequences are useful in diagnosis and therapy of pathological conditions, as molecular targets for diagnostics, prophylaxis and treatment of pathological conditions resulting from a bacterial infection, for evaluating a compound, such as a polypeptide, for the ability to bind a P. aeruginosa nucleic acid, as components of effective amtibacterial targets, as targets for antibacterial drugs, including anti-P. aeruginosa durgs, as templates for recombinant production of P. aeruginosa-derived peptides or polypeptides, as target components for diagnosis and/or treatment of P. aeruginosa-caused infection, and in detection of P. aeruginosa sequences or other sequences of Pseudomonas species using biochip technology. Sequences ABO67826-ABO84396 represent P. aeruginosa polypeptides of the invention. Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic format from USPTO at
                                                                                                                                                                                                                                                                    Novel isolated nucleic acid encoding Pseudomonas aeruginosa polypeptide, useful as molecular targets for diagnostics, prophylaxis and treatment of pathological conditions resulting from bacterial infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            antiinflammatory; neuroprotective; antianaemic; cytostatic; vulnerary;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             inflammatory, haematopolesis, immunity, neurodegenerative, stem cell; aplastic anaemia, cancer; wound healing; gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to Pseudomonas aeruginosa polypeptides and the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to an isolated nucleic acid molecule encoding a polypeptide which is believed to be cytostatic, antibatfammatory, immunosuppressive, antibacterial and virucidal. The composition and methods are useful for diagnosing, preventing and treating diseases such as proliferative (e.g. cancer), inflammatory, immune, metabolic, genetic, bacterial and viral diseases. The present sequence represents a human secreted protein. The present sequence is available on WIPOWEB and is not in the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New nucleic acid molecule for diagnosing, preventing or treating disk such as proliferative (e.g. cancer), inflammatory, immune, metabolic, genetic, bacterial and viral diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Bacterial infection; Pseudomonas aeruginosa infection; antibacterial

                                                                                                                                                                                                                                                                                                                                                                                                                                              Cytostatic; Antiinflammatory; Immunosuppressive; Antibacterial; Virucide; cancer; inflammatory; immune; human secreted protein.
                                                                                                                                                               The invention relates to a novel isolated polynucleotide and the encoded polypeptide. The molecules of the invention demonstrate antinflammatory, neuroprotective, antianaemic, cytostatic and vulnerary activities and may be useful in preparing a composition for diagnosing or treating inflammatory, haematopoletic, immune, neurodegenerative or stem cell disorders, such as aplastic anaemia or cancer, as well as for promoting procedures. The molecules may also be utilised during gene therapy procedures. The current sequence is that of a human therapeutic contig protein of the invention.
                                                           Y; Zhou P;
                                                                                                                New polynucleotide, useful in preparing a composition for diagnosing or treating inflammatory, neurodegenerative or stem cell disorders, e.g., aplastic anemia or cancer for promoting wound healing.
                                                                                                                                                                                                                                                                                            Gарв

              composition and methods are useful for diagnosing, preventing and treating diseases such as proliferative (e.g. cancer), inflammatory, immune, metabolic, genetic, bacterial and viral diseases. The present sequence represents a human secreted protein. The present sequence is available on WIPOWBB and is not in the specification.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to an isolated nucleic acid molecule encoding a polypeptide which is believed to be cytostatic, antifinamatory, immunosuppressive, antibacterial and virucidal. The composition and methods are useful for diagnosing, preventing and treating diseases such as proliferative (e.g. cancer), inflammatory, immune, metabolic, genetic, bacterial and viral diseases. The present sequence represents a human secreted protein. The present sequence is available on WIPOWEB and is not in the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New nucleic acid molecule for diagnosing, preventing or treating dise such as proliferative (e.g. cancer), inflammatory, immune, metabolic, genetic, bacterial and viral diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

New nucleic acid molecule for diagnosing, preventing or treating diseases such as proliferative (e.g. cancer), inflammatory, immune, metabolic, genetic, bacterial and viral diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to an isolated nucleic acid molecule encoding a polypeptide which is believed to be cytostatic, antiinflammatory, immunosuppressive, antibacterial and virucidal. The composition and methods are useful for diagnosing, preventing and treating diseases such as proliferative (e.g. cancer), inflammatory, immune, metabolic, genetic, bacterial and viral diseases. The present sequence represents a human secreted protein. The present sequence is available on WIPOWEB and is not in the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Bacterial infection; Pseudomonas aeruginosa infection; antibacterial.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Score 18; DB 8

```
The invention relates to Pseudomonas aeruginosa polypeptides and the polymucleotides encoding them. The sequences are useful in diagnosis and therapy of pathological conditions, as molecular targets for diagnostics, prophylaxis and treatment of pathological conditions resulting from a bacterial infection, for evaluating a compound, such as a polypeptide, for the ability to bind a P aeruginosa nucleic acid, as components of effective antibacterial targets, as targets for actibacterial drugs, including anti-P. aeruginosa drugs, as templates for recombinant components for diagnosis and/or treatment of P. aeruginosa-caused infection, and in detection of P. aeruginosa sequences or other sequences of Pseudomonas species using biochip technology. Sequences AB067826-C. Requence data for this patent did not form part of the printed specification but was obtained in electronic format from USPTO at sequence.
                                                                                                                        Novel isolated nucleic acid encoding Pseudomonas aeruginosa polypeptide, useful as molecular targets for diagnostics, prophylaxis and treatment of pathological conditions resulting from bacterial infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      KIAA0779; gene expression; inflammation; antiinflammatory; cancer; proliferation; neoplasm; cytostatic; immune disorder; immunomodulator; metabolic disorder; metabolic; viral infection; virucide; infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                0;

```
The invention relates to an isolated nucleic acid molecule comprises at least one polynucleotide sequence (appearing as AD25619-AD25613).

AD56199-AD256200, AD25522-AD25527 and AD25619-AD25621). sequences having to phymicicate acids are splice arrivable and applyanciations, sequences having at least use gene, encoding transmembrane domain protein(s). Also included acids of sequence identity to them, their complements or biologically acids and applyanciations. Sequences having at least 80% sequence identity to them, their complements or biologically acids molecule cited above, a vector comprising the human workers of an about a cid molecule cited above, an accord comprising the nucleic acid molecule cited above, an accord comprising the nucleic acid molecule of a promoter that regulates the comprising the nucleic acid molecule of and a promoter that regulates the comprising the nucleic acid molecule of an acond protein or the proteins of the nucleic acid molecule of making a recombinant host cell, a method of making a polypeptide a method of determining the presence of the proteins of the proteins of the mucleic acid molecule cited above, an isolated polypeptide or a specific antibody to the polypeptide of (4) in a sample, an antibody specifically binding to and/or interfering with the bological activity of the nucleic acid molecule cited above, the vector, the presence of the polypeptide or its biologically binding to and/or interfering with the bological activity of the nucleic acid molecule cited above, the vector, the crivity of the nucleic acid molecule cited above, the vector, the crivity of the nucleic acid molecule cited above, the vector, the crivity of the nucleic acid molecule cited above, the vector, the crivity and produces the antibody, and animal injected with one or mucleotides from the nucleic acid molecule cited above, the vector, the cost of molecule cited above, and the antibody, and adaptored with a model and an expension of method of making an antibody, and reagents to carry out an immunosa
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

New nucleic acid molecule for diagnosing, preventing or treating diseases such as proliferative (e.g. cancer), inflammatory, immune, metabolic, genetic, bacterial and viral diseases.
                                                                                                                                                                                                                                                                                        The present invention relates to an isolated nucleic acid molecule encoding a polypeptide which is believed to be cytostatic, antiinflammatory, immunosuppressive, antibacterial and virucidal. The composition and methods are useful for diagnosing, preventing and treating diseases such as proliferative (e.g. cancer), inflammatory, immune, metabolic, pacterial and viral diseases. The present sequence represents a human secreted protein. The present sequence is available on WIPOWEB and is not in the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

New isolated peptide that inhibits VEGF-C and VEGF-D, useful for diagnosing, evaluating, treating disorders mediated by VEGFR-3 activity, such as cancer and diseases of neovascularization.

Claim 13; Page 80; 149pp; English.

The present invention describes an isolated peptide (I) that binds to and inhibits vascular endothelial growth factor receptor 3 (VEGFR-3). (I) have cytostatic, hepatotropic, antiinflammatory, hypotensive, antidiabetic and wulnerary activities, and can be used in gene therapy. Compositions and methods from the present invention are useful for diagnosing, evaluating and treating disorders mediated by the activity of

```
The present invention describes an isolated peptide (I) that binds to and inhibits vascular endothelial growth factor receptor 3 (VEGFR-3). (I) have cytostatic, hepatotropic, antiinflammatory, hypotensive, antidiabetic and vulnerary activities, and can be used in gene therapy. Compositions and methods from the present invention are useful for diagnosing, evaluating and treating disorders mediated by the activity of
the cell surface receptor VEGFR-3 such as cancer, e.g. brain, lung, liver; spleen, kidney, lymph node, small intestine, blood cells, pancreas, colon, stomach, breast, endometrium, prostate, testicie, ovary, skin, head and neck, osephagus, bone, marrow or blood, and diseases of neovascularisation, e.g. liver diseases, hypertension, post-trauma, chronic hepatitis, haemangiomas and diabetes. The present sequence represents a specifically claimed VEGFR-3 binding peptide from the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Vascular endothelial growth factor receptor 3 inhibitor; VEGFR-3; angiogenesis; lymphangiogenesis; vascular endothelial growth factor; cytostatic; heparctoropic, antiinflammatory; hypotensive; antidiabetic; vulnerary; call surface receptor; cancer; neovascularisation; liver disease; hypertension; post-trauma; chronic hepatitis; haemangioma; diabetes; PDGF; platelet derived growth factor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New isolated peptide that inhibits VEGF-C and VEGF-D, useful for diagnosing, evaluating; treating disorders mediated by VEGFR-3 activity, such as cancer and diseases of neovascularization.
                                                                                                                                                                                                                        Gaps

(I) have cytostatic, hepatotropic, antiinflammatory, hypotensive, antidiabetic and wulnerary activities, and can be used in gene therapy. Compositions and methods from the present invention are useful for diagnosing, evaluating and treating disorders mediated by the activity of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          angiogenesis, lymphangiogenesis, vaccular endochelial growth factor, cytostatic, hepatotropic, antiinflammatory; hypotensive; antidiabetic; vulnerary; cell surface receptor; eancer; neovascularisation; liver disease; hypottension; post-trauma; chronic hepatitis; haemangioma; diabetes; PDGF; platelet derived growth factor.
the cell surface receptor VEGFR-3 such as cancer, e.g. brain, lung, liver, spleen, kidney, lymph node, small intestine, blood cells, pancreas, colon, stomach, breast, endometrium, prostate, testicle, ovary, skin, head and neck, oesophagus, bone, marrow or blood, and diseases of neovascularisation, e.g. liver diseases, hypertension, post-trauma, chronic hepatitis, haemangiomas and diabetes. The present sequence represents a specifically claimed VEGFR-3 binding peptide from the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New isolated peptide that inhibits VEGF-C and VEGF-D, useful for diagnosing, evaluating, treating disorders mediated by VEGFR-3 activity, such as cancer and diseases of neovascularization.
                                                                                                                                                                                                          Gaps

The invention relates to a novel method of selecting target and target binder pairs comprising mixing in a reaction vessel phage expressing bindors, each having distinguishable selection markers and selecting target and target binders pairs based on the selection markers. The molecules of the invention demonstrate cytostatic activity whilst the method may be useful for selecting target and target binder pairs for preparing a composition for treating cancer. Purthermore, the method may be utilised during gene therapy procedures. The current sequence is that of the cancer-related

                                                                                                                                                                                                                                     The invention relates to novel isolated polypeptides comprising a sequence that binds an immunoglobulin Fc region. The polypeptides are useful as binding molecules for detecting, isolating or purifying immunoglobulin Fc-region polypeptides present in a solution, e.g. blood, plasma or transgenic milk. The Fc-region binding polypeptides are also useful for regulating or preventing an antibody response, or for increasing the half-life and over all stability of a therapeutic or diagnostic compound that is administered to or enters the circulatory system of an individual. This sequence represents an Fc region binding

The sample comprises blood or serum, or is obtained from a biopsy. The sample may also be obtained from a tumour or a region within 5 mm of a tumour. The method is useful for detecting medilators that modulate interaction of serum protein-binding compound and serum protein and for identifying binding ligands for serum protein. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                respiratory; cytostatic; antiarthritic; antiinflammatory; gastrointestinal; antibacterial; immunosuppressive; antidiabetic; antirheumatic; gene therapy; molecular weight marker; chromosome marker; chromosome tag; genetic fingerprinting; nutritional supplement; cancer; inflammatory condition; arthritis; inflammatory bowel disease; Crohn's disease; sepsis; rheumatoid arthritis; diabetes mellitus type 1;
                                                     Evaluating sample comprising soluble serum protein by forming complex comprising serum protein and physically associated compounds using peptide ligand that specifically binds with proteins, which is separated and evaluated.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

The present invention describes an isolated polynucleotide (I): (a)

comprising a nucleotide sequence selected from SEQ ID NO:1-244; or (b),

which encodes a polypeptide with biological activity, where the

polynucleotide hybridises to (I) under stringent hybridisation conditions

corpostations procein sequences in the polynucleotides can be used for

generating polynucleotides encoding chimeric or fusion proteins and

corpostations procein sequences. The polynucleotides can be used to

express recombinant procein for analysis, characterisation or therapeutic

cytostations procein sequences. In which the corresponding procein is

preferentially expressed; as molecular weight markers on ggls; as

chromosome markers or tags to identify chromosomes or to map related gene

corpositions; to compare with endogenous DNA sequences in patients to

corporations to compare with endogenous DNA sequences in patients to

dentify potential genetic disorders; as probe to hybridise and discover

compost, including for examination of expression patterns; to raise anti-

corpose of discovering other novel polynucleotides; for

selecting and making oligomers for attachment to a gene chip or other

corpose of process of discovering other novel polynucleotides;

corpose of selecting and polypeptides or a also be used as an untigen

to raise anti-DNA antibodies or elicit another immune response. The

copplements, e.g. as a protein or amino acid supplement, as a carbon

cor supplements, e.g. as a protein or anion sed treat closure of non-

Cytogratic; antidiabetic; neuroprotective; cerebroprotective; ophthalmological; insulin; receptor; gene therapy; diabetes; insulin-like growth factor-1; IGF-1; tumour; prostate; breast; diabetic retinopathy; neurological diseases; stroke; diabetic neuropathy. Synthetic

The invention relates to a method of modulating insulin activity in mammalian cells by administering a peptide that binds the insulin receptor (IR). A composition containing a peptide, optionally expressed from gene therapy vectors, that binds to Site 1 of IR and an insulin agonist are useful for treating diabetes. Also, peptides that are antagonists of the insulin-like growth factor (IGF-1) receptor are useful for treating insulin-like growth factor (IGF) sensitive tumours (e.g. of prostate and breast) and diabettc retinopathy, while IGF-1 receptor agonists are useful for treating neurological diseases, including stroke and diabettc neuropathy. The peptides are also useful in therapeutics and research reagents. Adu88034-AAU90957 represent IR and/or IGF-1 receptor-binding peptides and related amino acid sequences of the Modulating insulin activity in mammalian cells, for treating e.g. diabetes and tumors, comprises using peptides that bind to insulin or insulin-like growth factor receptors. ```
This invention describes novel CDNA sequences (A) highly expressed in normal uterine tissue which can have anticancer and cytostatic activity and can be used for gene therapy. (A) are used (i) for recombinant or expression of polypeptides (B) and (ii) to isolate complete genes. (B) are used (i) to identify agents suitable for treatment of uterine cancer; (ii) directly for treating this form of cancer (including expression from gene therapy vectors) and (iii) for genet (including expression from gene therapy vectors) and (iii) for genetation of specific antibodies.

(A) are identified by assembling ESTS (expressed sequence tags) from a particular tissue type before comparison of expression patterns. This allows a significantly longer fragment of the gene to be revealed, so should reduce the number of failures associated with the fact that ESTS from different libraries may represent different parts of the same connecting the estimated frequency of occurrence in a particular tissue. AAYS9838-Y59892 represent protein fragments encoded by the human uterine tissue derived CDNA fragments represented in AAZ41325-
                                                                                                                                                                                                                         New nucleic acid sequences expressed in normal uterine tissues, and derived polypeptides, for treatment of uterine cancer and identification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Antisense; prokaryotic essential gene; cell proliferation; drug design.

The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the mucleic acid inhibites proliferation of a call. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid of a promoter operably linked to the nucleic acid of polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated of polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of agene in an operon required for proliferation or the activity of agene product or that has an activity against a biological pathway or required for proliferation, or that inhibits cellular proliferation; (8) identifying a gene required for cellular proliferation or the biological pathway in which a proliferation required denomination and proliferation or the biological pathway in which a proliferation required gene or its gene product lies or a gene on which the test compound that inhibits proliferation of an compound, a activity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent of strains; or (13) identifying the target of a compound that inhibits the proliferation of an organism. The antisense nucleic acids required for proliferation to isolate candidate molecules for rational dudy discovery programs, or for screening for homologous nucleic acids required for proliferation to isolate candidate molecules for retional dudy discovery programs, or for screening for homologous nucleic acids required for proliferation in cells one can seeful for required for proliferation in cells one can be enough one of the target prokaryotic essential genes. Note: The sequence data for this preceins of the printed for the printed for the printed for th
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Low density lipoprotein receptor binding protein; signal transduction;
LDL receptor binding protein; LDL receptor signalling pathway.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

New polynucleotides and encoded antigen binding molecules with increased Fc receptor binding affinity and effector function, useful for diagnosing, preventing or treating B-cell proliferative disorders, including B cell lymphoma.
                                                                                                                                                                                            receptor binding affinity and effector function. These antigen binding molecules may have modified glycosylation, and are especially specific for human B-cell marker CD20. The invention is useful for diagnosing, preventing or treating disorders or diseases treatable by B-cell depletion, such as B cell lymphoma. The present sequence represents the variable heavy chain region of the murine antibody B-Ly1, and antibody which binds CD20. The sequence is used to produce antigen binding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             antigen binding molecule; Fc receptor; B-cell marker; CD20; antibody engineering; B-cell depletion; B cell lymphoma; cytostatic; hematological disease; immune disorder; neoplasm.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                                     원
                                                                                                                                                                                                    The present invention describes a method for detecting a stress that alters a functional interaction of a low density lipoprotein (LDL) creceptor binding protein (IJ with an LDL receptor interaction domain (II). The method involves introducing a predetermined stress into a system which provides a stress-biased physical interaction of (I) which in the absence of the stress, the system provides an unbiased interaction of (I) and (II), and detecting the stress-biased interaction of (I) and (II), where in the reaction of (I) and (II), where a difference between BI and UI indicates that the stress alters the interaction of (I) and (II). (I) is selected from SEMCAP-1 JIP-1, MPD-1, TDP-1, and APC subunit 10. The method is useful channel brain 3 wintl, ICAP-1 and APC subunit 10. The method is useful conting a stress that alters functional interaction of LDL receptor binding polypeptide with LDL receptor interaction domain. The method is useful for detecting and modulating signal transduction through LDL receptors ABBDD transplant and ABBD of the present LDL receptors binding proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         1;
                                                                                                      Detecting stress that alters interaction of LDL receptor binding polypeptide with LDL receptor interaction domain, comprises detecting difference in stress-biased and unbiased interaction of peptide and

New polynucleotides and encoded antigen binding molecules with increased Fc receptor binding affinity and effector function, useful for diagnosing, preventing or treating B-cell proliferative disorders, including B cell lymphoma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New polynucleotides and encoded antigen binding molecules with increased Fc receptor binding affinity and effector function, useful for diagnosing, preventing or treating B-cell proliferative disorders, including B cell lymphoma.
                                                                                                   The specification describes antigen binding molecules with increased Foreceptor binding affinity and effector function. These antigen binding molecules may have modified glycosylation, and are especially specific for human B-cell marker CD20. The invention is useful for diagnosing, preventing or treating disorders or diseases treatable by B-cell depletion, such as B cell lymphoma. The present sequence represents an antigen binding molecule of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         <u>11</u>

```
CC The specification describes antigen binding molecules with increased FC receptor binding affinity and effector function. These antigen binding CC molecules may have modified glycosylation, and are especially specific CC for human B-cell marker CD20. The invention is useful for diagnosing, CC preventing or treating disorders or diseases treatable by B-cell CC antigen binding molecule of the invention.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
